TITLE: Description of ammonium-diuranate produced in the pilot plant at Kalna

SOURCE: Tehnika, no. 9, 1966, 1530-1536

TOPIC TAGS: ammonium compound, ammonium diuranate, thermal decomposition, thermogravimetric analysis, uranium compound, x ray diffraction analysis, differential thermal analysis, chemical analysis/ADU-Kalna

ABSTRACT: The thermal decomposition of ammonium-diuranate (ADU) was investigated using thermogravimetric analysis (TGA) in the 20—900-C range. All the TGA experiments were carried out on a Stanton thermobalance having  $\pm 0.0001$ -g sensitivity. It was found that by continuous heating from 20 to 120C at a rate of 5 C/min, ADU loses moisture. Crystalline water loss takes place at 120—200C. Gaseous ammonia evolution begins at 270C and ceases at 450C. A plateau from 450 to 570C and a negligible loss of weight is characteristic of pure uranium trioxide.

ACC NR: AP6032805

Further loss of oxygen according to the reaction  $\text{UO}_3 \rightarrow \text{U}_3\text{O}_8$  takes place at 570—675C. No change in weight was noticed at 675—900C. Chemical analysis, differential thermal analysis, and x-ray diffraction were used for correct determination of ADU composition. It was concluded that ADU-Kalna has the following composition:  $(\text{NH}_2)_0.4\text{UO}_3 \cdot 7\text{H}_2\text{O}$  (70-80%) and  $\text{UO}_3 \cdot n\text{H}_2\text{O}$  (20-30%). In addition, the kinetics of the chemical processes taking place during thermal decomposition was also interpreted mathematically. Orig. art. has: 10 figures, 2 tables, and 4 formulas.

Title : Developing Poplar Seeds in a Water Culture and from Pot Specimens.

Orig Pub : Shumarestvo, 1957, 10, No 5-6, 351-357.

Abstract : The experiments were done in the winter of 1956-1957 in the laboratory of the Scientific Research Forestry Institute of Serbia and in the greenhouses of the forestry department in Belgrade. In one case branches with floral buds were immersed in water. Flowers of *Populus bachofeni* were pollinated with aspen and white poplar pollen. Aspen blossoms on branches in water culture were pollinated with aspen and white poplar pollen. After 15 days aspen x aspen and aspen x white poplar seeds were acquired. Pollination of *P. bachofeni* did not give any results.
